Plasma Etching: Dielectric Materials

“Effects of CH$_2$F$_2$ Addition on a High Aspect Ratio Contact Hole Etching in a C$_4$F$_6$/O$_2$/Ar Plasma”
H.-K. Ryu, B.-S. Lee, S.-K. Park, I.-W. Kim

The profile / CD control and resist selectivity for etching of 0.17 μm contact holes (TEOS, DUV resist) with 15:1 aspect ratio were studied as a function of CH$_2$F$_2$ addition to a C$_4$F$_6$ based chemistry. The experiments were performed in a MERIE reactor at 45 mTorr, 1800 W, 100 G. SEM cross sections show a thicker fluorocarbon passivation film for the CH$_2$F$_2$ added chemistries. A reduction in sidewall bowing is observed when the CH$_2$F$_2$ flow was increased. For a flow of 20 sccm CH$_2$F$_2$, sidewall bowing is virtually absent and the resist selectivity is increased from 3.8 to 5.8. XPS analysis shows that the fluorocarbon films on oxide were carbon-rich in the presence of CH$_2$F$_2$ gas.
